Jesus and Identity Markus Cromhout, 2010-02-25 New Testament scholarship lacks an overall interpretive framework in which to understand Judean identity. This lack of interpretive framework is quite acute in scholarship on the historical Jesus, where the issue of Judeanness ('Jewishness') is most strongly debated. A socio-cultural model of Judean ethnicity is developed, being a synthesis of (1) Sanders' notion of covenantal nomism, (2) Berger and Luckmann's theories on the sociology of knowledge, (3) Dunn's 'four pillars of Second Temple Judaism' and his 'new perspective' on Paul, (4) cultural or social anthropology in the form of modern ethnicity theory, and lastly, (5) Duling's Socio-Cultural Model of Ethnicity. The proposed model is termed Covenantal Nomism. It is a pictorial representation of the Judean 'symbolic universe', which as an ethnic identity, is proposed to be essentially primordialist. The model is given appropriate content by investigating what would have been typical of first-century Judean ethnic identity. It is also argued that there existed a fundamental continuity between Judea and Galilee, as Galileans were ethnic Judeans themselves and they lived on the ancestral land of Israel. Attention is lastly focused on the matter of ethnic identity in Q. The Q people were given an eschatological Judean identity based on their commitment to Jesus and the requirements of the kingdom of God.

Characters of Finite Groups. Part 1 IA. G. Berkovich E. M. Zhmud', 1997-12-02 This book discusses character theory and its applications to finite groups. The work places the subject within the reach of people with a relatively modest mathematical background. The necessary background exceeds the standard algebra course with respect only to finite groups. Starting with basic notions and theorems in character theory, the authors present a variety of results on the properties of complex-valued characters and applications to finite groups. The main themes are degrees and kernels of irreducible characters, the class number and the number of nonlinear irreducible characters, values of irreducible characters, characterizations and generalizations of Frobenius groups, and generalizations and applications of monomial groups. The presentation is detailed,

and many proofs of known results are new. Most of the results in the book are presented in monograph form for the first time. Numerous exercises offer additional information on the topics and help readers to understand the main concepts and results.

Volume 1 Yakov G. Berkovich, Lev S. Kazarin, Emmanuel M. Zhmud', 2017-12-18 This updated edition of this classic book is devoted to ordinary representation theory and is addressed to finite group theorists intending to study and apply character theory. It contains many exercises and examples, and the list of problems contains a number of open questions.

Lectures in General Algebra A. G. Kurosh, 2014-07-10 Lectures in General Algebra is a translation from the Russian and is based on lectures on specialized courses in general algebra at Moscow University. The book starts with the basics of algebra. The text briefly describes the theory of sets, binary relations, equivalence relations, partial ordering, minimum condition, and theorems equivalent to the axiom of choice. The text gives the definition of binary algebraic operation and the concepts of groups, groupoids, and semigroups. The book examines the parallelism between the theory of groups and the theory of rings; such examinations show the convenience of constructing a single theory from the results of group experiments and ring experiments which are known to follow simple corollaries. The text also presents algebraic structures that are not of binary nature. From this parallelism arise other concepts, such as that of the lattices, complete lattices, and modular lattices. The book then proves the Schmidt-Ore theorem, and also describes linear algebra, as well as the Birkhoff-Witt theorem on Lie algebras. The text also addresses ordered groups, the Archimedean groups and rings, and Albert's theorem on normed algebras. This book can prove useful for algebra students and for professors of algebra and advanced mathematicians.

Isolated Involutions in Finite Groups Rebecca Waldecker, 2013-10-23 This text provides a new proof of Glauberman's Z^* -Theorem under the additional hypothesis that the simple groups involved in the centraliser of an isolated involution are known simple groups.

thoroughly refereed post-conference proceedings of the 36th International Workshop on Graph-Theoretic Concepts in Computer Science, WG 2010, held in Zarós, Crete, Greece, in June 2010. The 28 revised full papers presented together with two invited papers were carefully reviewed and selected from 94 initial submissions. The papers feature original results on all aspects of graph-theoretic concepts in Computer Science, e.g. structural graph theory, sequential, parallel, randomized, parameterized, and distributed graph and network algorithms and their complexity, graph grammars and graph rewriting systems, graph-based modeling, graph-drawing and layout, random graphs, diagram methods, and support of these concepts by suitable implementations - as well as applications of graph-theoretic concepts in Computer Science.

Additive Subgroups of Topological Vector Spaces Wojciech Banaszczyk, 2006-11-14 The Pontryagin-van Kampen duality theorem and the Bochner theorem on positive-definite functions are known to be true for certain abelian topological groups that are not locally compact. The book sets out to present in a systematic way the existing material. It is based on the original notion of a nuclear group, which includes LCA groups and nuclear locally convex spaces together with their additive subgroups, quotient groups and products. For (metrizable, complete) nuclear groups one obtains analogues of the Pontryagin duality theorem, of the Bochner theorem and of the Lévy-Steinitz theorem on rearrangement of series (an answer to an old question of S. Ulam). The book is written in the language of functional analysis. The methods used are taken mainly from geometry of numbers, geometry of Banach spaces and topological algebra. The reader is expected only to know the basics of functional analysis and abstract harmonic analysis.
